Definition of the z-Transform  $\hat{z}$  Given a finite length signal  $x[n]$ , the z-transform is defined as (7.1) where the sequence support interval is  $[0, N]$ , and  $z$  is any complex number  $\hat{z}$ . This transformation produces a new representation of denoted  $\hat{z}$ . Returning to the original sequence (inverse z-transform)

III. The standardized normal distribution. a. General Procedure. As you might suspect from the formula for the normal density function, it would be difficult and tedious to do the calculus every time we had a new set of parameters for  $\hat{\mu}$  and  $\hat{\sigma}$ . So instead, we usually work with the standardized normal distribution, where  $\hat{\mu} = 0$  and  $\hat{\sigma} = 1$ , i.e.  $N(0,1)$ .

z-Scores A z-score is a location on the distribution. A z-score also automatically communicates the raw score's distance from the mean. A z-score describes a raw score's location in terms of how far above or below the mean it is.
